Frontend Assignment - Logistics Order Form & Live Preview

Objective

Build a **visually polished logistics order form** with a **real-time shipment preview**.

This assignment evaluates:

- UI/UX design quality
- React fundamentals & hooks
- JavaScript logic
- CSS architecture & layout skills
- Code quality and structure

Assignment Overview

Create a **two-column interface**:

- **Left panel** → Order creation form
- **Right panel** → Live shipment preview

Both panels must remain visible side-by-side on desktop and adapt gracefully to smaller screens.

Functional Requirements

Shipment Details

- Order ID (auto-generated, read-only)
- Shipment Date
- Delivery Type (Standard / Express)

Consignor (Sender)

- Name
- Address
- City
- Pincode

Consignee (Receiver)

- Name
- Address
- City
- Pincode

Package Information (Multiple Packages)

The order can contain **multiple packages**.

Each package must include:

- Package Name / Label
- Weight (kg)
- Length (cm)
- Width (cm)
- Height (cm)
- Declared Value (₹)

Package behavior:

- Add multiple packages
- Remove a package
- Minimum one package required
- Each package should be independently editable

Additional Options

- Fragile (checkbox)

- Insurance Required (checkbox)

Live Preview (Right Panel)

The preview should update **in real time** and display:

- Order ID & shipment date
- Sender & receiver summary
- Delivery type badge
- List of all packages with details
- Calculated values:
  - Total number of packages
  - Total shipment weight
  - Total declared value
- Visual indicators for:
  - Fragile
  - Insured

The preview should resemble a **real logistics shipment summary**.

UI / UX Expectations (High Priority)

This is a **design-first assignment**.

We expect:

- Clean layout & visual hierarchy
- Thoughtful spacing and typography
- No default browser styling
- Clear separation between form and preview
- Responsive behavior (desktop, tablet, mobile)

A visually unpolished UI will be considered incomplete.

Technical Constraints (Strict)

- Use **React** (Next.js preferred but optional)
- **CSS Modules only** for styling
  - No inline styles
  - No global CSS files
  - No CSS-in-JS libraries
- Modern JavaScript (ES6+)
- Clean, modular component structure
- No external form libraries
- No UI frameworks (MUI, Ant, Chakra, etc.)

Deliverables (Mandatory)

Please share **all three**:

1. **Figma design link**
   - Reflects layout, spacing, typography, and components
   - Should closely match the implemented UI
2. **GitHub repository link**
   - Public repository
   - Clear project structure
   - Readable commits preferred
3. **Live deployed preview link**
   - Hosted on a free platform (for example: Vercel, Netlify, etc.)
   - Application must be fully functional

Submissions missing any deliverable will be considered incomplete.

Time Expectation

- **6–8 hours**
- Quality > quantity

Evaluation Criteria

UI / UX

- Visual polish
- Spacing & typography
- Responsiveness
- Consistency

Frontend Engineering

- React fundamentals & hooks
- Dynamic list handling
- JavaScript logic
- Performance awareness

CSS Quality

- Proper use of CSS Modules
- Scalable class naming
- Layout structure (Flex/Grid)
- No styling hacks

Code Quality

- Readability
- Reusability
- Maintainability

Bonus (Optional)

- Subtle animations using CSS Modules
- Thoughtful empty & edge states
- Basic accessibility considerations
